

# HERE COMES 5G Millimeter Wave Radiation: Forcibly Delivered to Everyone!

In July 2016, only weeks after federal scientists announced that cell phone radiation induces cancer, the Federal Communications Commission (FCC) announced its intention to **increase America's wireless pollution by millions-fold** with fifth generation (5G) wireless technologies.

The 5G technologies will transform nearly **every structure** and **every inanimate object in our environment** into active radio antennas capable of mobile communication. The nation-wide 5G buildout requires **multi-millions of small, but powerful new microwave and millimeter wave antennas called microcells** to be mounted on any structure or surface, tucked into any crevice at ground level. The plan is to transform all US public utility corridors into chains of new mini cell towers. Utility poles, lights and many non-pole structures in the public right-of-way will support 4G/5G antennas spaced apart every few homes or buildings. This carcinogen-spewing equipment will be located close to bedroom windows, offices, schools, hospitals and nursing homes.

The 5G will ultimately utilize millimeter microwaves between **24 to 86 gigahertz** to accommodate the upcoming Internet of Things (IoT). The IoT (electronic eyes everywhere) has potential to become the most sinister tracking and surveillance system ever devised. When the urban and rural 5G broadband network is completed nationwide, **no living creature anywhere** will escape the continual bombardment of millimeter wave carcinogen-on-steroids. Here is what medical experts of the BioInitiative Working Group say about 5G wireless technologies and the upcoming millions of new millimeter wave antennas needed to support them:

**"The FCC is proposing to streamline the process for small wireless facility permitting, without completing its investigation of RF health effects of low-intensity radiofrequency radiation....Health consequences have not been factored into public safety limits. This is particularly true of the new 5G technologies using millimeter wave frequencies....There is no basis for the FCC to make a positive assertion of safety of existing RE levels to which the public is perpetually exposed. Certainly unaddressed health concerns should stop the FCC from expediting new wireless technologies facilitating new small cell siting and satellite RF sources. The existing FCC public safety limits are grossly inadequate to protect public health from the body burden of the existing proliferation of RF-emitting devices and the wireless infrastructure supporting them, let alone from new RF sources that will make the situation worse for public health."**

Anyone can obtain affordable audio testing meters that allow people to hear and measure 2G, 3G and 4G antenna radiation. But we will never know when **experimental millimeter waves** are turned on in the neighborhood, the workplace, the school, because affordable audio testing equipment for high-band gigahertz frequencies are not currently available to the consumer. Frequencies are numbered for their oscillations per second. Millimeter waves within the gigahertz spectrum agitate human flesh at **double-digit billions of hertz**. This means that 5G antennas, propagating 24 to 86 gigahertz, will continually assault all living things with invasive photon energy that artificially oscillates the polarity of tissues **24 to 86 billion times per each measurable second!**

This matters! Scientists working with the National Toxicology Program induced aggressive brain cancer and malignant heart tumors in rats by using GSM cell phone radiation that oscillates the flesh at a **measly 900 million (megahertz) cycles per second**. US military scientists efficiently induced benign and malignant tumors in rats with a **mere 2.45 billion (gigahertz) cycles per second used for Wi-Fi**. When European scientists microwaved human blood cells with 1.8 billion hertz (at a power density lower than that used for cell phones), after only 24 hours **those blood cells had incurred damage equivalent to 1600 chest X-rays**.

None of the upcoming 5G millimeter frequencies have been properly tested for their biological effects because such testing would literally horrify potential victims. Thanks to five appointed bureaucrats at the FCC, and their mighty army of radiation peddlers, 324 million Americans shall **now be forced to gather this information the hard way**. What little we know so far is that double-digit gigahertz radiation in the millimeter spectrum has documented capacity to: **penetrate and inflame the skin, tear apart the DNA, affect growth, manipulate the genes, endanger eyesight and induce a cascade of other potentially disastrous biological ramifications not yet understood**. Millimeter waves absorb and interact with both water and oxygen, two vital components of human flesh. Over two decades ago, scientists experimenting with millimeter waves noted that these hyper-frequencies have potential to affect molecules with **"resonant vibrational or rotational interactions, not seen at lower frequencies"** even at power densities **hundreds of times lower** than the FCC's public exposure limits currently permit.

**Is 5G carcinogen coming to a utility pole near YOUR bedroom window?**
