

The microwave radiation blasting from your device is scientifically linked to various types of human cancers: brain, breast, thyroid, salivary gland, skin and eye.

Wireless device manufacturers, including Apple, Samsung and Google Nexus now warn that wireless devices should be kept a distance away from the human body to avoid overexposure to microwave radiation. So why would you keep a transceiving wireless device directly in your hand, on your head or in your pocket?

Addiction specialist Dr. Nicholas Kardaras explains why: "We now know that those iPads, smart phones and Xboxes are a form of digital drug. Recent brain imaging research is showing that they affect the brain's frontal cortex--which controls executive functioning--including impulse control--in exactly the same way that cocaine does. Technology is so hyper-arousing that it raises dopamine levels --the feel-good neurotransmitter most involved in the addiction dynamic-- as much as sex."
