

Wi-Fi oscillates the polarity of living cells
billions of times per second!

Here's what Wi-Fi can do for you:

Wi-Fi is pulsed microwave radiation generally propagated in the electromagnetic range between 2.45 and 5-6 gigahertz. Wi-Fi signals are used for a variety of wireless technologies. Like cell phone radiation, Wi-Fi microwaves **initiate and accelerate** the growth of tumors. In the 1980s, the U.S. Air Force spent millions of dollars to expose test rats to 2.45 gigahertz radiation at very low, non-thermal power. Compared to non-exposed rats, the irradiated rats suffered:

16% more benign tumors
260% more primary malignant tumors

Bioelectromagnetics Research Laboratory, University of Washington, Chou et al., 1984

In the 1990s, while one team of researchers was using 2.45 gigahertz to severely damage rat DNA (Lai et al., 1997), another team found that 2.45 gigahertz caused cancer-prone mice to suffer a 41% increase in tumors and a highly significant 12.5% increase in chromosome damage to bone marrow and blood. (Vijayalaxmi et al., 1997, 1998) In 2008, French researchers exposed rats to gigahertz radiation for two hours per day to produce blood abnormalities and tumors. (Vandendorpe et al., 2008) Cancer begins with damaged DNA.

Radiation peddlers ADORE Wi-Fi! It is **lucrative and unregulated** technology. These profiteers now deploy Wi-Fi signal generators everywhere, both indoors and out. While scientists concur that 90 percent of cancers are induced by environmental carcinogens, there is no limit to how much Wi-Fi radiation can be propagated into the environment. All Americans are test rats as we are irradiated with Wi-Fi radiation 24/7.

Wi-Fi radiation is a teratogen (causes birth defects) exactly like ionizing nuclear radiation. Microwaves are documented in numerous studies to damage reproductive cells, cause pregnancy failure and induce fetal abnormalities. Human sperm is quickly damaged by Wi-Fi and damaged sperm can make **damaged babies**. With millions of hot spots across the nation, it is little surprise that the U.S. suffers a roaring epidemic of autism, Down Syndrome and many childhood developmental disabilities.

Before people develop microwave-induced tumors or blood cancers, they often suffer from warning symptoms linked to gigahertz radiation. Documented adverse effects of Wi-Fi include: headaches, heart problems, sleep abnormalities, forgetfulness and brain fog, skin complaints, gastrointestinal upsets, chronic fatigue, impaired motor function, allergies, soft tissue pain, depression, tinnitus (ringing in the ears), hearing loss, visual disturbances, impaired balance, thyroid dysfunction, lymph node swellings, joint and limb pain, abnormal bleeding.

Decades of published scientific research shows that low-level 2.45 to 6 gigahertz microwave radiation used for Wi-Fi systems can:

- Cause human cells to produce free radicals (illness and inflammation)
- Precipitate abnormal heart function in 40% of people exposed
- Induce memory and learning failure
- Damage the eye cornea and cloud the lens (cataracts)
- Deform red blood cells and damage bone marrow
- Cause animal fetuses to die
- Initiate the production of many types of tumors
- Promote the growth of existing tumors

The American Cancer Society estimates that in 2022 **1,918,030 people** in the U.S. will be given a **new invasive cancer diagnosis**.

They will join the nearly **17 million** already afflicted with cancer.

Wi-Fi everywhere insures that the U.S. cancer epidemic continues with momentum.
